Zavod za termodinamiku, strojarstvo i energetiku

# ENERGETIKA

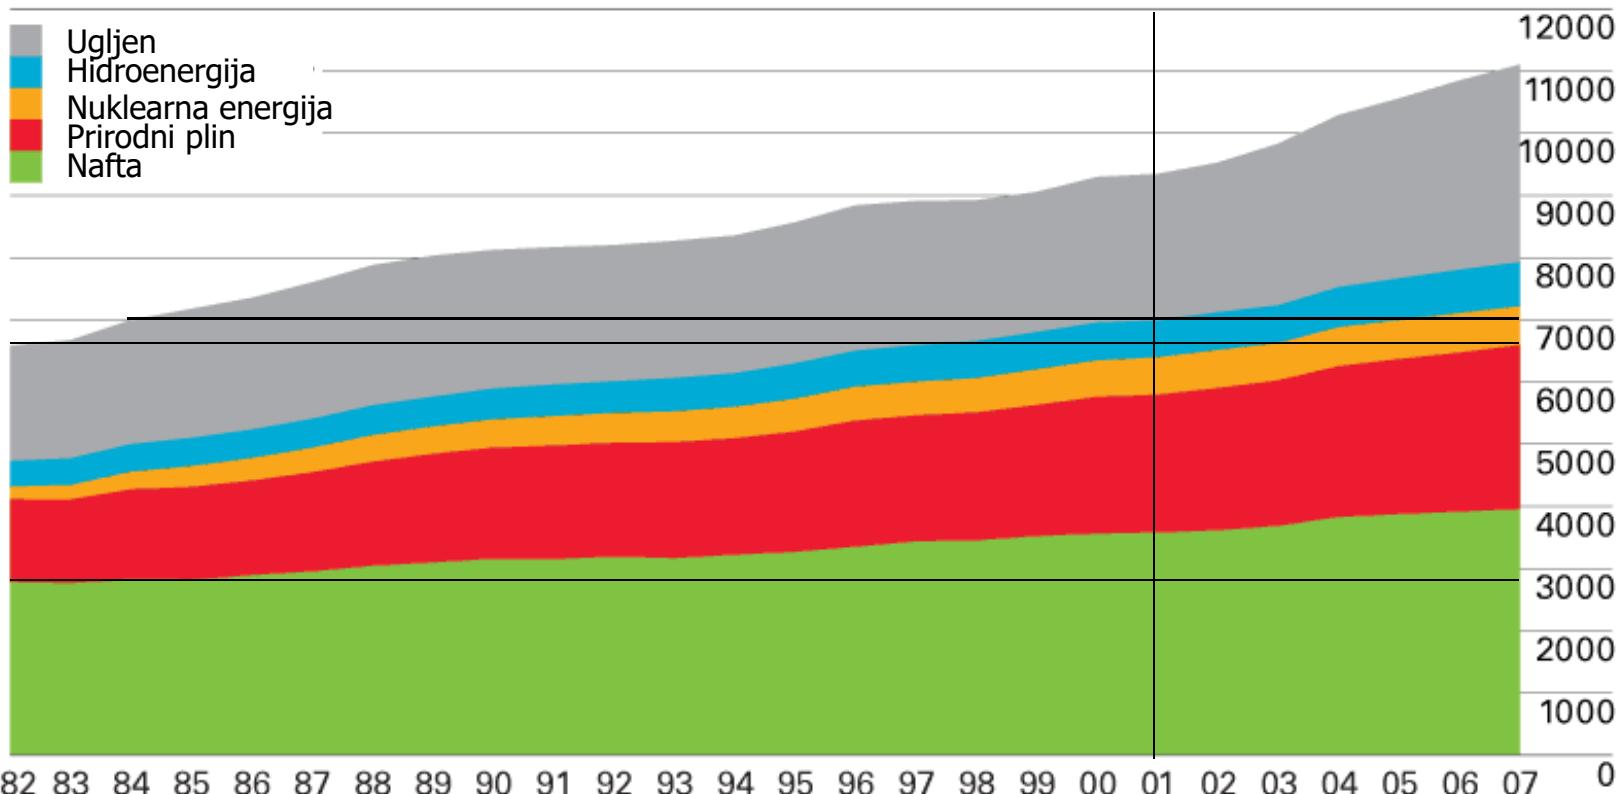

Studij: Kemijsko inženjerstvo (V semestar)

prof. dr. sc. Igor Sutlović

## Potrošnja primarne energije u Svijetu

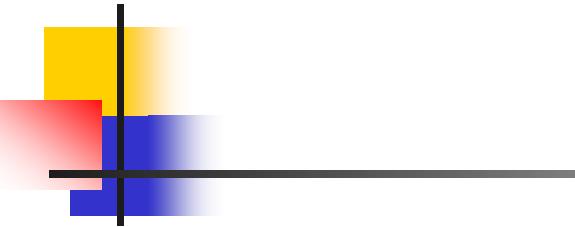

BP Statistical Review of World Energy 2008.

Svjetska potrošnja, mil. toe

Svjetska potrošnja primarne energije usporila je rast 2007., iako je rast od 2,4% još uvijek iznad 10 godišnjeg prosjeka. Potrošnja ugljena najbrže je rasla, dok je porast potrošnje nafte usporen. Nafta je i dalje najzastupljenije gorivo ali je u šest uzastopnih godina izgubila udio na globalnom tržištu dok je ugljen u šest uzastopnih godina povećao udio na globalnom tržištu.

Energetika, prof. dr. sc Igor Sutlović

Starost fosilnih goriva –  
Hrvatski prirodoslovni  
muzej, Demetrova 1,  
Zagreb

GEOLOŠKA RAZDOBLJA		STAROST U MILIJUNIMA GODINA POČEV OD DANAS	
MEZO- ZVAK	PALEOGEN	KVAKTAR	
		HOLOCEN	0.01
		PLEISTOCEN	1.64
		PLIOCEN	5.3
		PONIT	7.1
		Panion	
		Sarmat	11.5 13.0
		Baden	
		Karpat	16.4
		Oltang	17.2
		Eggenburg	18.8 20.5
		Eger	23.8
		OLIGOCEN	33.7
		EOCEN	56.5
		PALEOCEN	65.0

		Bracki „marmor“	

Handwritten notes corresponding to the geological time scale:

- HOLOCEN: Homo sapiens, Krapinski praočajek, Plin u Jadranu
- PLEISTOCEN: Ugrijen u sjevernoj Hrvatskoj
- PLIOCEN: Nafta u Podravini → Poravini, Paško jezero
- PONIT: Ilgijen u Hrvatskom Zagorju →
- Panion: Ugrijen u Sivericu → Benkovacki kamen
- Sarmat: Podravini → Poravini
- Baden: Paško jezero
- Karpat: Ilgijen u Hrvatskom Zagorju →
- Oltang: Benkovacki kamen
- Eggenburg: Ilgijen u Hrvatskom Zagorju →
- Eger: Ilgijen u Hrvatskom Zagorju →
- OLIGOCEN: Ilgijen u Sivericu →
- EOCEN: Benkovacki kamen
- PALEOCEN: Bracki „marmor“
- KREDA: Bracki „marmor“

## Nafta-osnovne činjenice

Nafta (kao primarni izvor energije) se dijeli na:

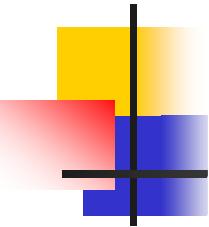

- konvencionalnu i
- nekonvencionalnu (teška nafta, bitumen, naftni pijesci, nafta u škriljavcima)

## Koliko ima još nafte? Nitko ne zna!?

Konvencionalna nafta:

- 1939. godine tvrdilo se da su zalihe u SAD-u za još 13 godina (sic!)
- 1950. godine tvrdilo se da su zalihe 1 bilijun bbl, a 68 godina kasnije (2008. g.) te su se zalihe čak i povećale (1,238 bilijuna bbl)

Source of data – the estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, World Oil, Oil & Gas Journal and Chinese reserves based on official data and information in the public domain.

†Less than 0.05.

\*Less than 0.05%.

n/a not available.

\*More than 500 years.

**Notes:** Total proved reserves of oil – generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for total proved oil reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent bp's view of proved reserves by country. Reserves-to-production (R/P) ratio – if the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Canadian oil sands 'under active development' are an official estimate. Venezuelan Orinoco Belt reserves are based on the OPEC Secretariat and government announcements.

Reserves and R/P ratio for Canada includes Canadian oil sands. Reserves and R/P ratio for Venezuela includes the Orinoco Belt. Saudi Arabia's oil reserves include NGLs from 2017.

Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

Shares of total and R/P ratios are calculated using thousand million barrels figures.

Source: includes data from FGE Iran Service.

\*Includes crude oil, shale oil, oil sands, condensates (lease condensate or gas condensates that require further refining) and NGLs (natural gas liquids – ethane, LPG and naphtha separated from the production of natural gas).

Excludes liquid fuels from other sources such as biofuels and synthetic derivatives of coal and natural gas. This also excludes liquid fuel adjustment factors such as refinery processing gain.

Excludes oil shales/kerogen extracted in solid form.

•Less than 0.05%.

Note: Annual changes and shares of total are calculated using thousand barrels daily figures.

Growth rates are adjusted for leap years.

\*Inland demand plus international aviation and marine bunkers and refinery fuel and loss. Consumption of biogasoline (such as ethanol), biodiesel and derivatives of coal and natural gas are excluded. Derivatives of coal and natural gas are included.

•Less than 0.05%.

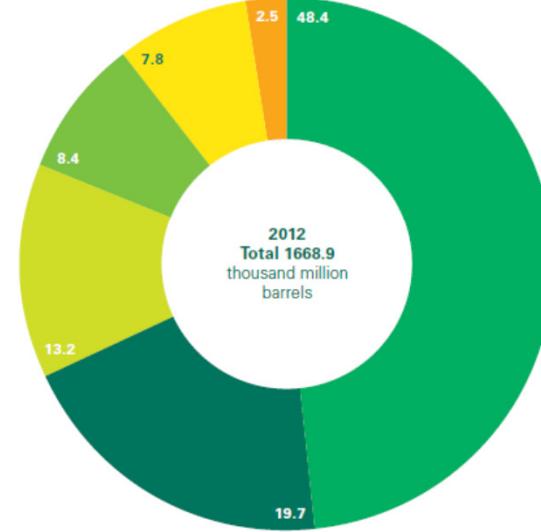

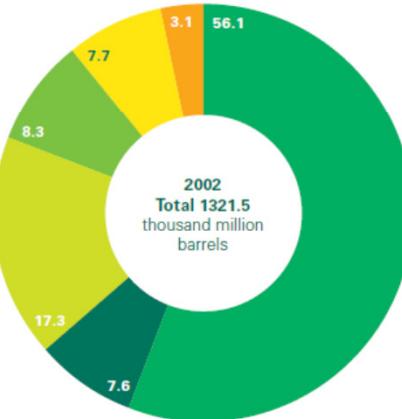

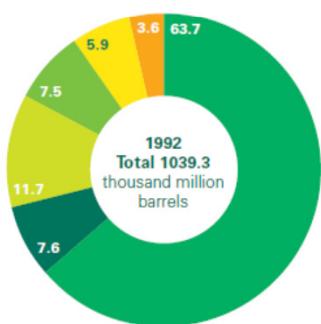

**Notes:** Differences between these world consumption figures and world production statistics are accounted for by stock changes, consumption of non-petroleum additives and substitute fuels, and unavoidable disparities in the definition, measurement or conversion of oil supply and demand data.

**Annual changes and shares of total are calculated using thousand barrels daily figures.**

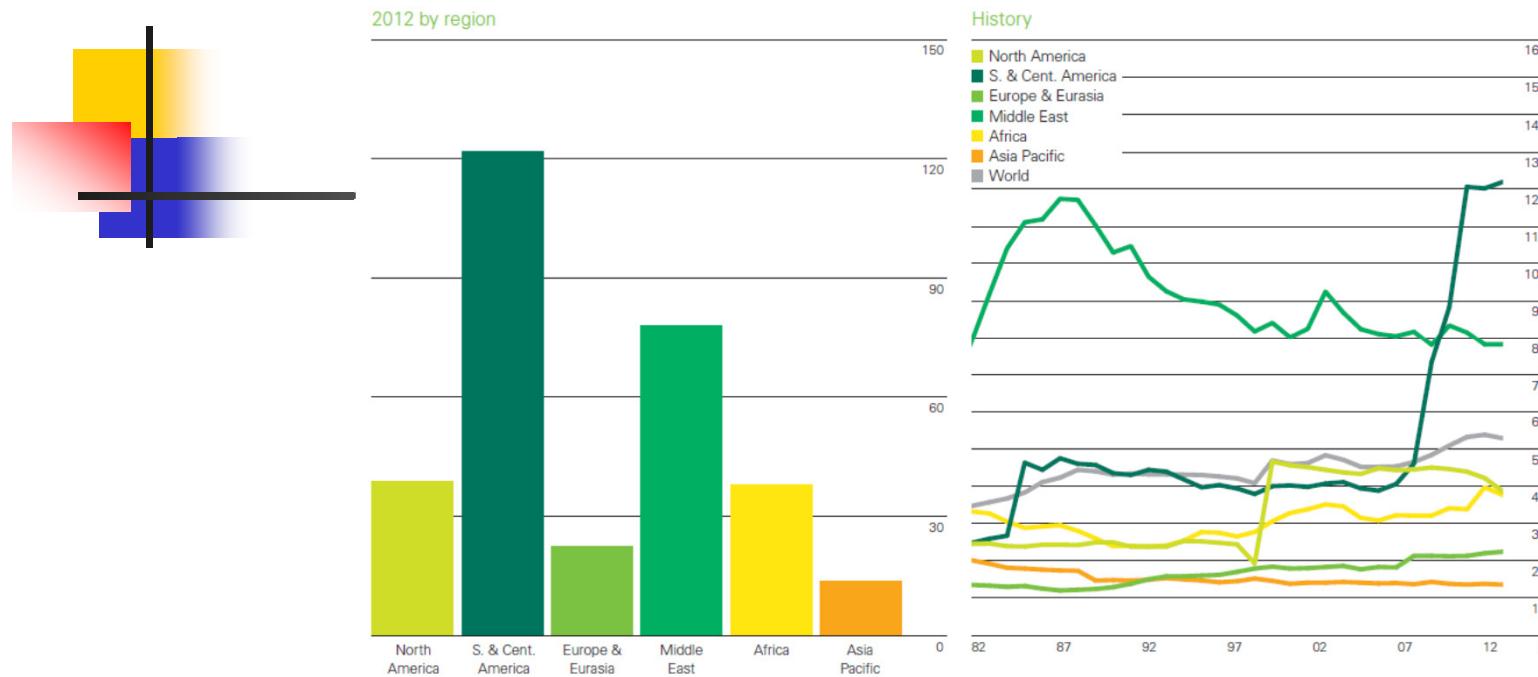

Growth rates are adjusted for leap years.

Udio proizvedenih količina nekonvencionalne nafte (tight oil-slabopropusne formacije) i prirodnog plina (shale gas - plin iz šejlova - škriljevaca) (Izvor: U.S. Energy Information Administration, Annual Energy Outlook 2014.)

Neka objašnjena uz prethodnu tablicu.

OPEC – Organization of the Petroleum Exporting Countries (Organizacija zemalja izvoznica nafte).

Osnovan je 1960. godine u Bagdadu, Irak.

Članice (13 država): Alžir, Angola, Ekvador, Indonezija, Iran, Irak, Kuvajt, Libija, Nigerija, Katar, Saudijska Arabija, UAE i Venecuela.

OPEC+-Azerbaijan, Bahrain, Brunei, Kazakhstan, Malaysia, Mexico, Oman, Russia, South Sudan and Sudan

EOR – Enhanced Oil Recovery – metode povećanja iscrpka nafte

Predviđa se dominacija konvencionalne nafte do 2030. godine.

- 
- Nafta se eksplloatira na kopnu (on shore) ili moru (off shore)
  - Eksplloatacija s većih dubina ovisna je o tehnološkom razvoju
  
  - Nafta se transportira kopnenim putem – naftovodima ili
  - morskim putem tankerima

## Eksplotacija i transport sirove nafte

Energetika, prof. dr. sc Igor Sutlović

## Janaf – Jadranski naftovod

Trase JANAFO naftovoda

Trasa Route	Promjer Diameter (")	Duljina Length (km)

Slavonski Brod – Sotin (hrvatsko-srpska granica / Croatian-Serbian border)	26	84

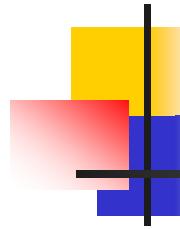

Izvor: JANAFO

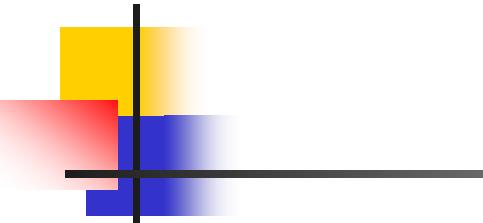

## Jadranski naftovod-“JANAF”

## Terminal u Omišlju na Krku

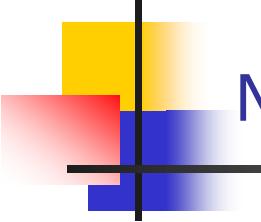

## Prosječni elementarni sastav nafte (maseni udjel):

- ugljik 84-87 %
- vodik 11,0-14,0 %
- sumpor 0,1-3,0 % (najviše 7%)
- dušik 0,1-0,6 % (najviše 3%)
- kisik 0,1-0,6 % (najviše 2%)
- teški metali: 0,01-0,03 %
- (oko 40 elemenata: V,Ni,Cr,Fe,Al,Si,Ca,Mg,K....)

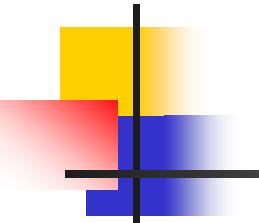

## Najzastupljeniji kemijski spojevi u nafti su:

- n-alkani i izoalkani
- cikloalkani (nafteni)
- aromatski ugljikovodici
- sumporni spojevi i dušikovi spojevi
- kisikovi spojevi
- anorganske nečistoće

Nafta se sastoji od približno 3000 ugljikovodika, od kojih se većina pojavljuje u tragovima

Udjel ugljikovodika ovisan je o porijeklu nafte, od 50% u "teškoj meksičkoj nafti do 98% posto u "lakoj" pensilvanijskoj nafti

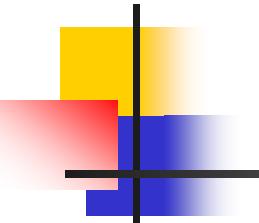

Sastav nafte obično se iskazuje udjelom triju najvažnijih skupina ugljikovodika:

- parafina
- cikloparafina
- aromatskih ugljikovodika

## Svojstva nafte ovise o njenom sastavu

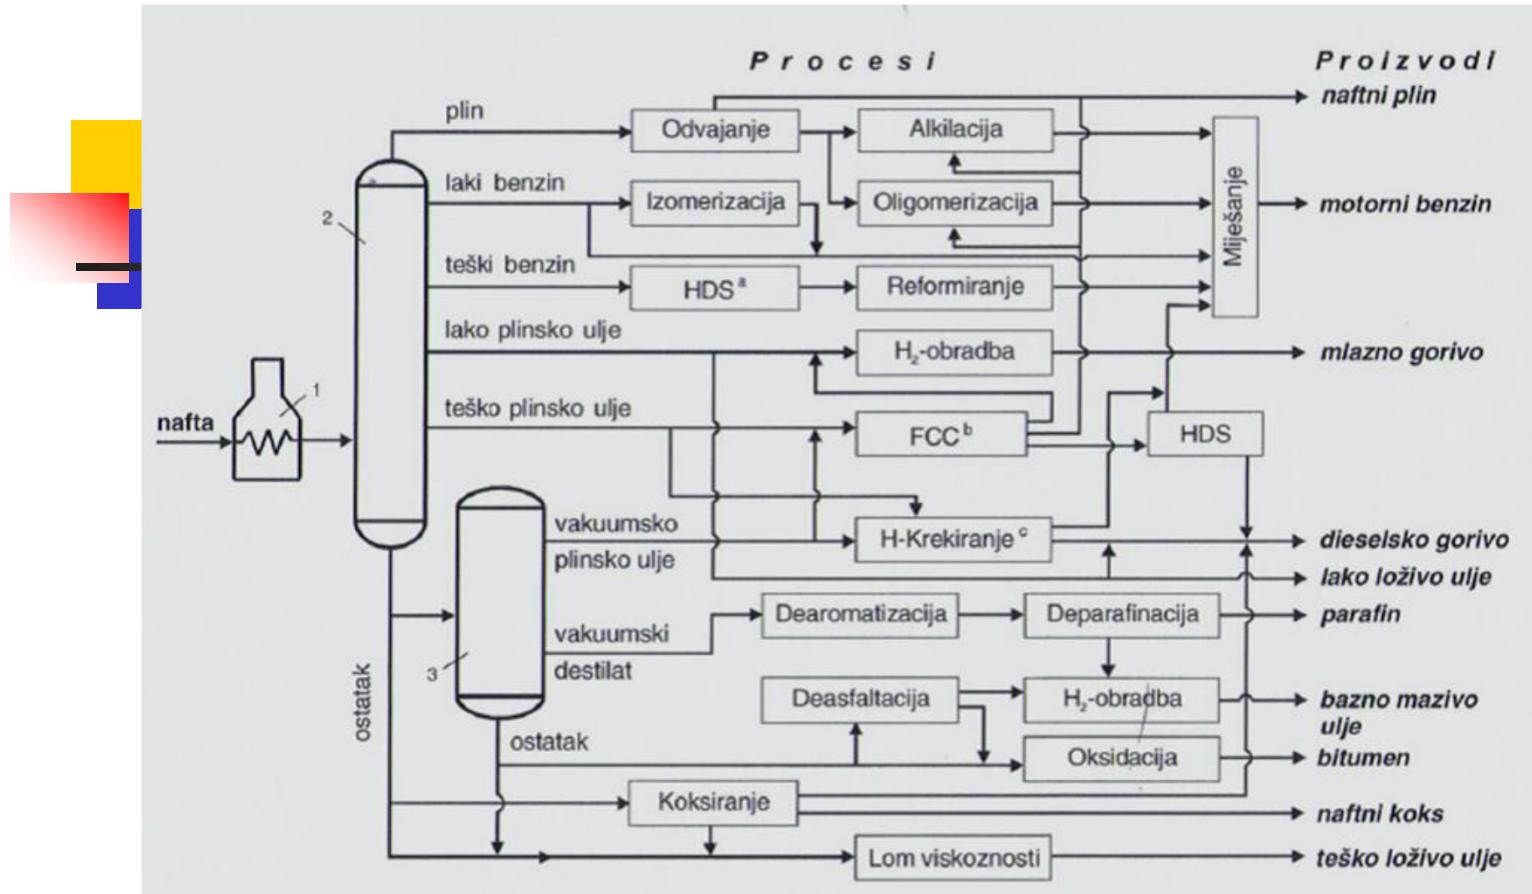

- *lake nafte* sadrže veći udjel niževrijijućih ugljikovodika – vrijedniji spojevi
- naftama s većim udjelom neugljikovodika, prije svega sumpora (više od 0,5%) prethodno se moraju ukloniti sumporovi spojevi (merkaptani, disulfidi, tioeteri, tiofen)
- Nafte koje se sada prerađuju imaju veću gustoću (manji udio lakovrijijućih frakcija) i veći udio sumpora – prerađuje se sve nekvalitetnija nafta.

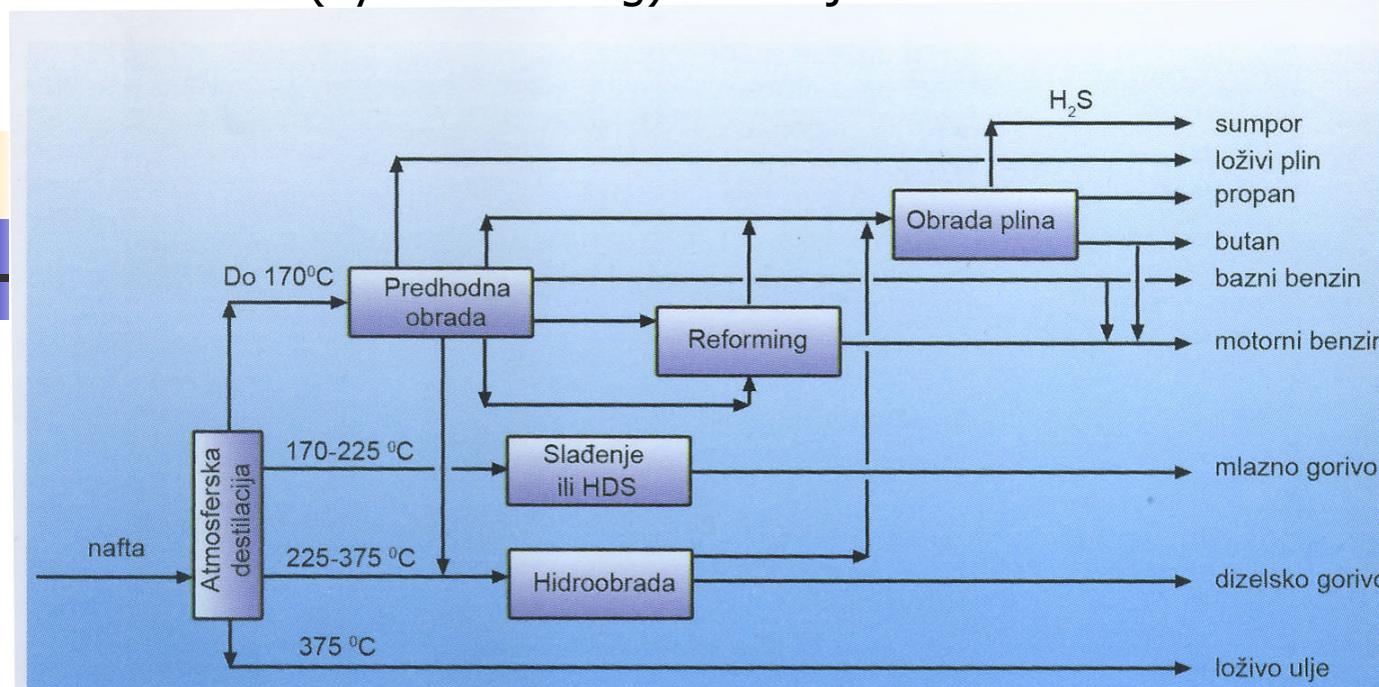

Nafta se sastoji od vrlo velikog broja ugljikovodika i drugih spojeva od kojih svi imaju različita svojstva između ostalog i različite temperature vrelišta (20 do 700°C).

Zbog toga je naftu potrebno preraditi izdvajanjem pojedinih grupa spojeva – destilacijskih frakcija u užem području temperatura vrelišta.

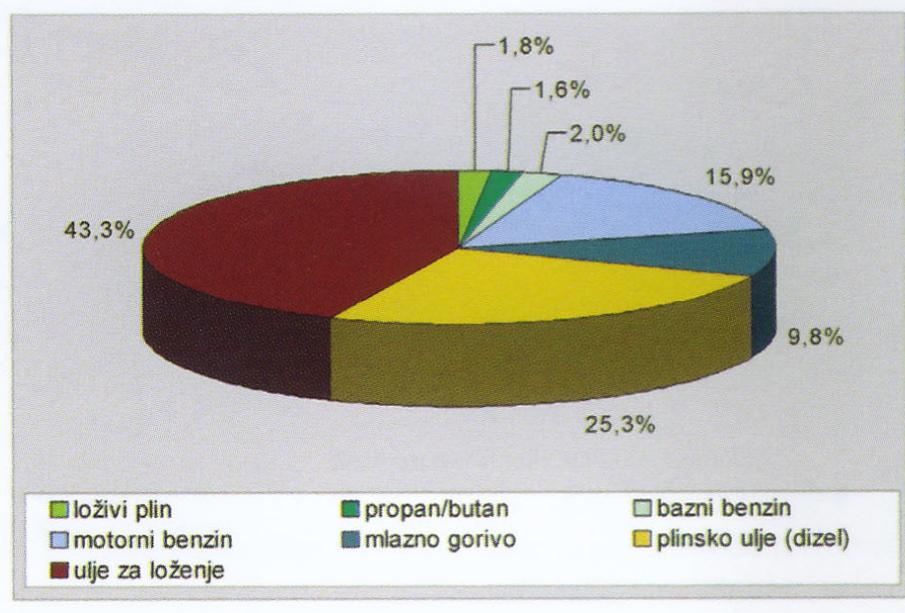

Dobiveni proizvodi koriste se izravno ili služe kao sirovina za druge proizvode.

sumpor		0,9	1,4

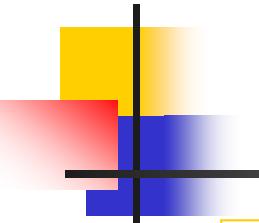

## Temeljni naftni proizvodi

- Motorni benzin je smjesa ugljikovodika, a dobiva se miješanjem primarnog benzina i benzina dobivenih katalitičkim kreiranjem, reformacijom i alkilacijom i dr.
- Potpunim izgaranjem benzina oslobađa se velika količina topline (egzotermna r.) cca. 43700 kJ/kg
- nepotpunim izgaranjem nastaju CO i zaostali ugljikovodici, najviše aromatski ugljikovodici, te  $\text{NO}_x$ ;  $\text{SO}_x$  - ekotest
- oktanski broj govori o kvaliteti benzina obzirom na jednolikost izgaranja, uobičajene vrijednosti su od 90 do 105,
- Aromatski ugljikovodici imaju visoke vrijednosti OB, ali su otrovni, benzen do 0,1%, ukupni do 42%, a od 2005. do 35%,
- sumporovi spojevi su nepoželjni u gorivu jer stvaraju s. okside (zagađenje), a smanjuju i djelotvornost katalizatora ( $\text{CO}$  u  $\text{CO}_2$ , i  $\text{NO}_x$  u  $\text{NO}_2$ ), u EU do 2003. 150ppm (maseni), a od 2005. 50ppm

- Zrakoplovni (avionski) benzin služi kao gorivo za zrakoplove i helikoptere s klipnim benzinskim motorom,
  - ima nižu vrijednost stiništa (-60°C)(stinište-smanjenje tečljivosti pri nižim temperaturama, dolazi do izlučivanja i kristalizacije parafinskih ugljikovodika i prestanka tečenja),
  - mora imati veliku kaloričnu vrijednost
- 
- Zrakoplovno (avionsko) mlazno gorivo koristi se kao gorivo za mlazne motore,
  - frakcija je benzina i petroleja iz primarne (atmosferske) destilacije nafte.
  - mora imati veliku kaloričnu vrijednost

- dieselsko gorivo služi za pogon dieselskih motora,
- smjesa je petrolejske frakcije i frakcije lakog plinskog ulja
- cetanski broj ukazuje na sklonost zapaljenju, veća vrijednost veća sklonost zapaljenju
- propisi EU postrožuju kvalitetu, uz ostalo do 2005. sumpor<150ppm, a nakon toga <50ppm. , CB>51.

- loživo ulje čini smjesa ugljikovodika visokoga vrelišta i najviše se koristi kao visokokalorično gorivo za loženje,
- dobivaju se nakon odvajanja benzina i drugih "lakih" sastojaka ili su izravan ostatak pri atmosferskoj ili vakumskoj destilaciji.
- *destilacijska loživa ulja odn. plinska loživa ulja (lako i teško)*- manje gustoće i viskoziteta i manj udjela S spojeva za grijanje domaćinstava, škola i sl.,
- *ostatna loživa ulja- lako, srednje i teško*-nastaju frakcioniranjem naftnih destilacijskih ostataka-viskozna su , gusta i tamno obojena. Najpoznatije je teško loživo ulje - mazut ili bunker ulje za pogon velikih brodskih motora i termoenergetskih objekata

- 
- Maziva mineralna ulja – maziva dobivena miješanjem baznih ulja i odgovarajućih dodataka (5 do 20%)
  - bazna mineralna ulja smjesa su viših ugljikovodika dobivenih višestrukim postupcima prerade nafte.
- 
- Parafinski vosak zajednički naziv za.
  - čvrsti parafin,
  - cerezin,
  - vazelin (medicinski i kozmetički)

- Bitumen – smolasta, viskozna, tamno obojena tvar smjesa je pretežito aromatskih heterocikličkih ugljikovodika, nalazi se i u prirodi, a najviše se dobiva obradom rafinerijskih ostataka nafte.
- u širem smislu bitumeni su većina organskih tvari u zemljinoj kori; nafta, prirodni plin, bit. ugljen, škriljavci i prirodni asfalt,
- ima više vrsta bitumena koji se razlikuju u svojstvima
- najpoznatiji je *asfaltni bitumen* za proizvodnju asfalta u kombinaciji s s agregatima kamena – služi u građevinarstvu

## Euro norme

Homologacijskim propisima (u Europi ECE – pravilnici i EEC – smjernice) određene su dopuštene granice emisija štetnih tvari i propisane metode ispitivanja sljedećih štetnih sastojaka:

- ugljikovog monoksida (CO),
- ugljikovodika (HC) i
- dušikovih oksida ( $\text{NO}_x$ ).

Kod Diesel motori dodatno je još ograničena i

- količina čestica PM (engl. Particulate Matter; najveći dio njih čini čađa),
- neprozirnost ispušnih plinova i nemetanski ugljikovodici (NMHC).

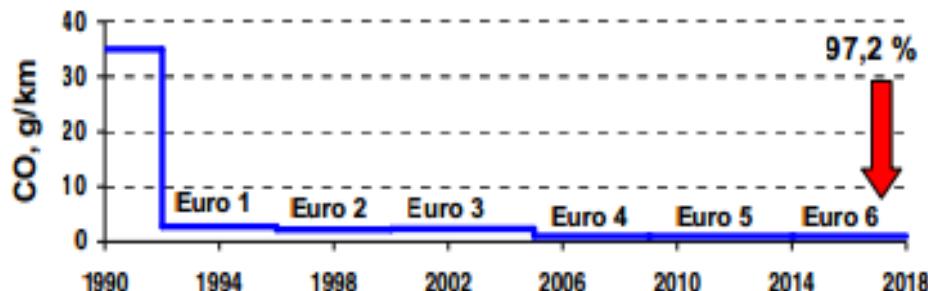

Kod vozila na pogon stlačenim prirodnim plinom ograničena je i količina metana ( $\text{CH}_4$ ) u ispušnim plinovima. Također je ograničena i količina hlapljivih tvari koje vozilo ispušta u okoliš iz spremnika i sustava za gorivo.

Smanjivanje emisija štetnih tvari provodi se kontinuiranim poboljšanjima procesa izgaranja u cilindru motora, pročišćavanjem ispušnih plinova nakon što izađu iz motora, poboljšavanjem kvalitete goriva (prvenstveno smanjivanjem sadržaja sumpora), smanjivanjem otpora vožnje i optimiranjem upravljanja radom motora i vozila u cjelini.

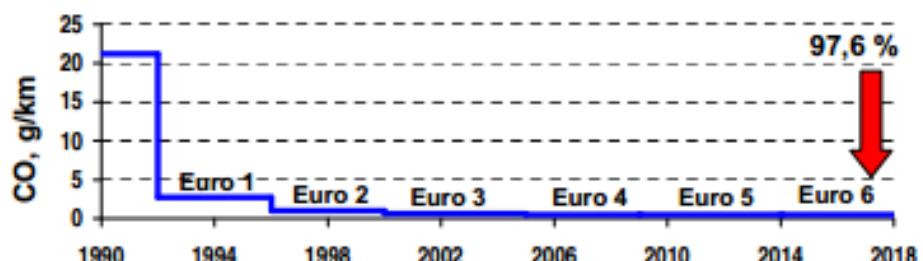

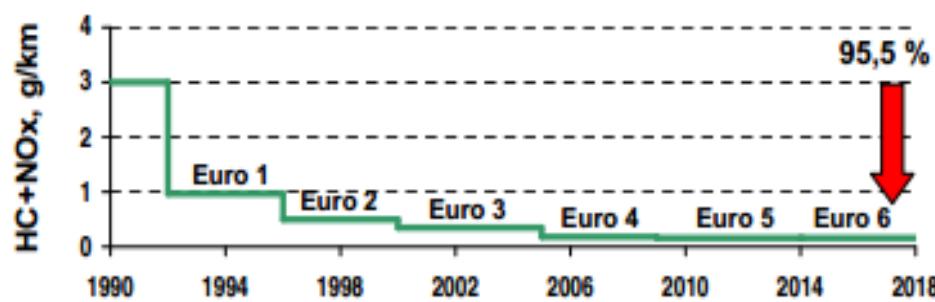

U početku je u Europi u ispušnim plinovima automobilskih motora bila ograničena samo emisija CO, od 1970. godine ograničena je i emisija HC.

Od 1977. ograničena je emisija NOx samo za Otto motore, a od 1988. ograničena je i količina čestica (PM) kod Diesel motora.

**Od 1992. godine pojedine razine dopuštenih emisija štetnih tvari nose naziv Euro.**

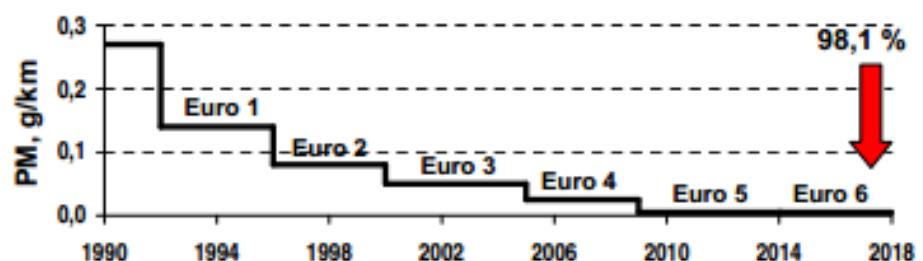

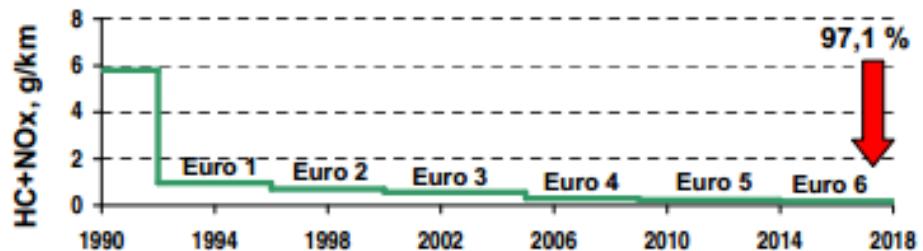

Smanjenje emisije Otto motora vozila kategorije osobna vozila

Smanjenje emisije Diesel motora vozila kategorije osobna vozila

- CO-ugljični monoksid
- HC-ugljikovodici
- NO<sub>x</sub>-dušični oksidi
- PM-krute čestice (particulate matter)-većinom čađa
- NMHC-nemetanski ugljikovodici

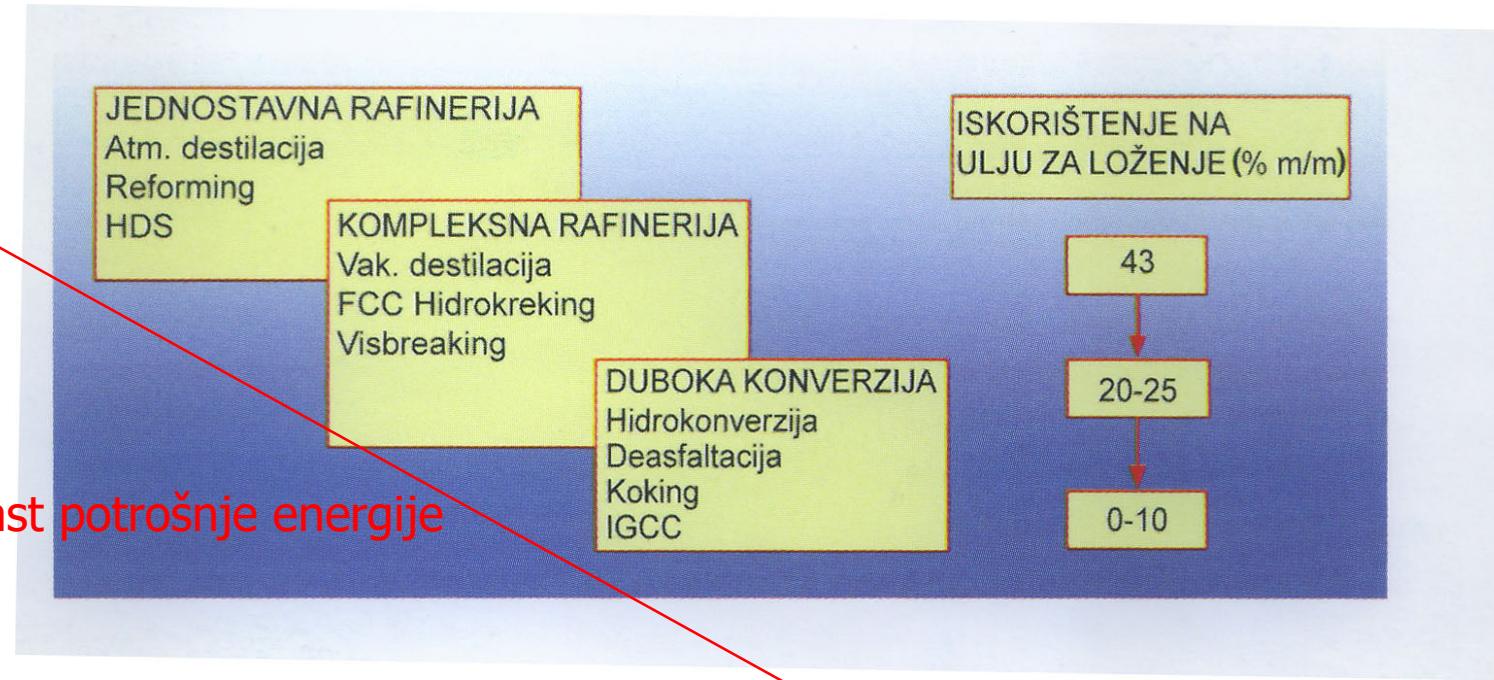

## Maksimalne dopuštene količine (g/km) pojedinih štetnih tvari za osobna vozila\*

	Datum stupanja na snagu	CO	HC	NMHC	NO <sub>x</sub>	HC + NO <sub>x</sub>	PM
Dieselovi motori

\* Prije Euro 5 norme, osobna vozila koja su imala masu veću od 2500 kg ulazila su u kategoriju malih komercijalnih vozila.

\*\* Vrijednosti koje vrijede samo za vozila s motorom sa direktnim ubrizgavanjem

Porast potrošnje energije

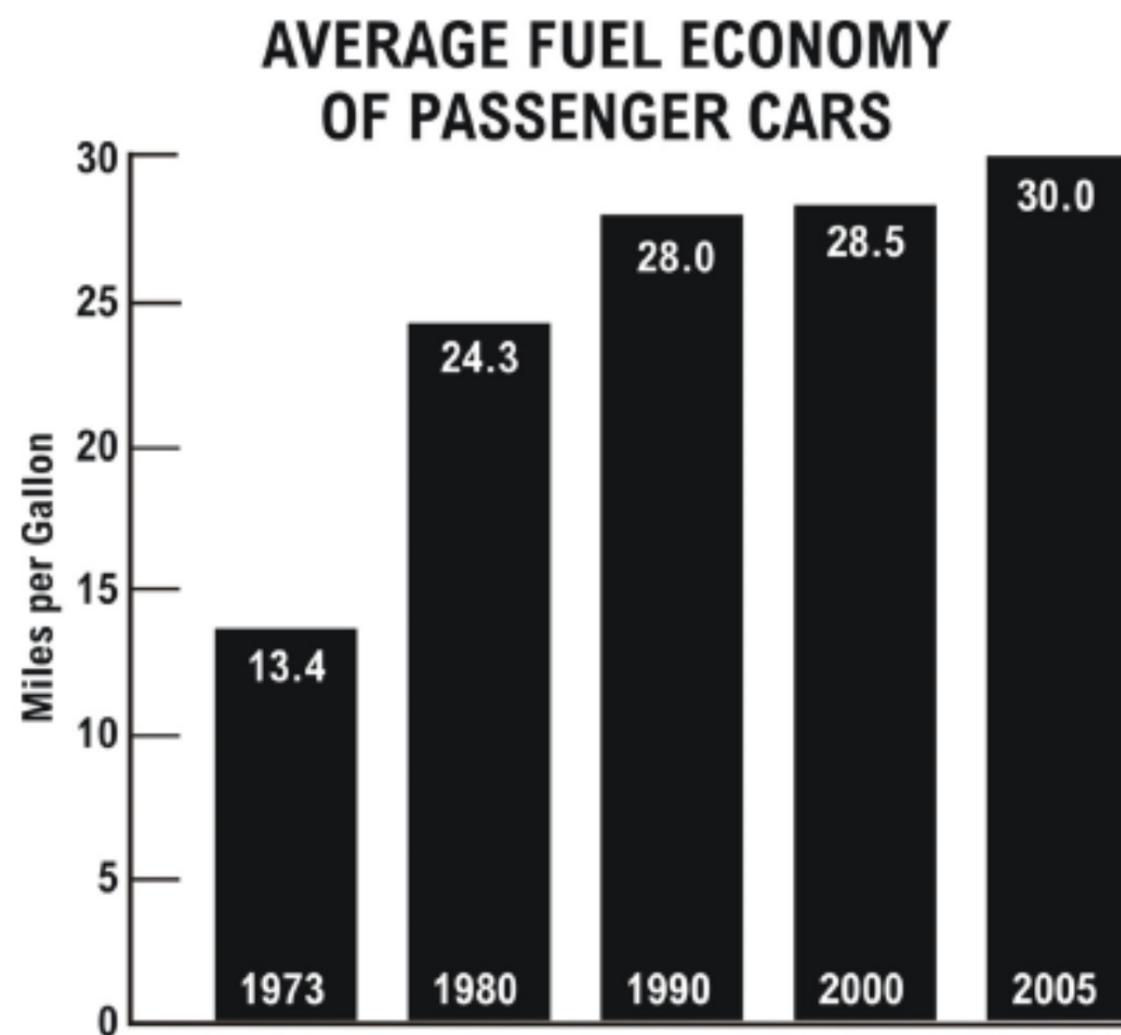

## Prerada nafte energetski je intenzivan proces

- U prosjeku se 7 do 15% energetskog ekvivalenta ulazne sirovine (sirove nafte) troši se u rafinerijskim procesima.
- dvije najveće NL rafinerije izvjestile su o 7% (1995.)
- u SAD-u izvjestile su o 15%, a trenutno 9 do 10%

"Shell" navodi povećanje emisije CO<sub>2</sub> od 18MtC u 2003. godini u odnosu na godinu prije, a također se navodi da je prerada nafte u Californiji energetski intenzivnija nego u drugim saveznim državama SAD-a **samo zbog strožih propisa odnosno nižeg sadržaja sumpora u gorivu.**

## Nužno se mora povećavati energetska učinkovitost
